Abstract:
Human immunodeficiency/acquired immunodeficiency virus has shattered the lives of many individuals across the globe. There were so many viral infections which used to challenge the mankind but the advancements in the medical sciences with the help of medical centers, NGO’s, social organizations and media so many dreadful viral conditions came under control and we could eradicate viral infections like small pox. As HIV/AIDS infection and its propagation are very much interlinked with human errors against their whims and fancies like drug addiction, accidental contamination with HIV infected personnel, homosexuals and professional or non professional heterosexuals including sex workers. A questionnaire study is conducted to know and evaluate the challenges for effective control of HIV/AIDS by year 2050 and results are analyzed.

Aims & Objectives: To know the awareness of HIV/AIDS control existing now and to know the future challenges those require an innovative work for the effective control of AIDS till we achieve a day of total eradication.

Materials and methods: A questionnaire study was done among the medical and dental fraternity along with other NGO’s involved in AIDS control.

Results: Results are discussed.
